Quantitative Methods – I
A.Y. 2020-21

Practice 5

Lorenzo Cavallo

For any clarification/meeting: cavallo@istat.it

Summary of the Practice

1. Recap on probability distributions of discrete variables
2. Continuous Random Variables
3. Normal distribution
4. Standard Normal Distribution
5. Chi Square, Student's T and Fisher's F

THEME #1

—

Recap on probability distributions of discrete variables

Recap on Discrete Random Variables

For Binomial and Bernoulli sometimes you can find q instead of (1-p)

Bernoulli Probability Distribution

$P(x_i) = p^{x_i}(1-p)^{(1-x_i)}$ $E(X) = p$ and $Var(X) = p \cdot (1-p)$

Binomial Random Variable

$P(x) = \binom{n}{x} p^x (1-p)^{(n-x)}$ with n as total number of occurrences and x number of selected occurrences

$E(X) = n \cdot p$ and $Var(X) = n \cdot p \cdot (1-p)$

Poisson Probability Distribution

$P(X = x) = \frac{\lambda^x e^{-\lambda}}{x!}$ with λ as average number of occurrences in a given interval and x number of occurrences

$E(X) = Var(X) = \lambda$

Exercise 1

For each point, indicate first what probability distribution is used to solve the problem.

a. 60% of people who purchase sports cars are men. If 10 sports car owners are randomly selected, find the probability that exactly 7 are men.

b. The evaporation of water for a pool in California is (on average) 2 centimeters per month (30 days). Find the probability that the pool has lost 5 centimeters of water in August.

c. 1% of the product sold by Apple have some bugs. Find the probability that for 100 products sold at most 1 have bugs.

d. A company receives on average 3 returns of defective product per month. Find the probability that a randomly selected product sold in October could be defective.

Exercise 1

Solution

a. 60% of people who purchase sports cars are men. If 10 sports car owners are randomly selected, find the probability that exactly 7 are men.

a. We have to use the Binomial Distribution because the possible outcome are only 2:
men who **PURCHASE** sports car (event 1) and men who **NOT PURCHASE** sports car (event 0).
Identify 'n' and 'x' from the problem.
n is the number of randomly selected items, that in this case is sports car owners, and is 10, and x, the number of men you are asked to "find the probability" for, that is 7
Find "p" the probability of success and "1-p" or "q" the probability of failure.
We are given p = 60%, or 0.6. therefore, the probability of failure is 1 – 0.6 = 0.4 (40%)
$P(X=7)= \frac{n!}{(n-x)!\,x!} \times p^x \times (1-p)^{n-x} = \frac{10!}{3!\,7!} \times 0.6^7 \times 0.4^3 = 120 \times 0.0279936 \times 0.064 = 0.215 = 21.5\%$

b. The evaporation of water for a pool in California is (on average) 2 centimeters per month (30 days).
Find the probability that the pool has lost 5 centimeters of water in August.

b. We have to use the Poisson Distribution because we have number of occurrence (cm of evaporation) in a given interval of time (a month).
Identify 'λ' and 'x' from the problem.
λ=2 (evaporation per month) and x=5 (evaporation in August)
$P(X=5) = \frac{\lambda^x e^{-\lambda}}{x!} = 2^5 \times e^{-2} / 5! = 0.3609 = 3.6\%$

Exercise 1

Solution

c. 1% of the product sold by Apple have some bugs. Find the probability that for 100 products sold at most 1 have bugs.

c. We have to use the Binomial Distribution because the possible outcome are only 2: the product **has a bug** (event 1) and the product **has NOT a bug** (event 0). Identify ‘n’ and ‘x’ from the problem.

n=100 x=1

The probability are: p = 0.01 and (1-p)=0.99

$P(X=1)= \frac{n!}{(n-x)!\,x!} \times p^x \times (1-p)^{n-x} = \frac{100!}{99!1!} \times 0.01^1 \times 0.99^{99} = 100 \times 0.01 \times 0.3697 = 0.3697 = 36.97\%$

d. A company receives on average 3 returns of defective product per month. Find the probability that a randomly selected product sold in October could be defective.

d. We have to use the Poisson Distribution because we have number of occurrence (return of products) in a given interval of time (a month).
Identify ‘λ’ and ‘x’ from the problem.
λ=3 (return products per month) and x=1 (defective product sold in October)

$P(X = 1) = \frac{\lambda^x e^{-\lambda}}{x!} = 3^1 \times e^{-3} / 1! = 3 \times 0,049 / 1 = 0,147 = 14,7\%$

Exercise 2

On average a household receives 3 telemarketing phone calls per month. Find the probability that a randomly selected household receives:

a. exactly 2 calls during a given month;

b. exactly 1 call during a given week (assume 4 weeks each month);

c. Find the expected value

Solution

To calculate the points a. b. and c. we have to use the Poisson probability distribution

$$P(X = x) = \frac{\lambda^x e^{-\lambda}}{x!}$$

where λ is the number of telemarketing calls received per month (λ =3)

a. We have to calculate $P(X = 2)$.

Using the Poisson distribution, $P(X = 2) = \frac{\lambda^x e^{-\lambda}}{x!} = \frac{3^2 e^{-3}}{2!} =$ 9 · 0.049 / 2 = 0.2205 = 22.5%

b. If the calls per month are 3, the calls per week are:

λ = 3 calls per month /4 weeks = 0.75 calls per week

So, $P(X = 1)$ = 0.75^1 · e^(-0.75) / 1! = 0.75 · 0.4724 = 0.3543 = 35.43%

c. For the Poisson distribution: E(X) = Var(X) = λ = 3

THEME #2

—

Continuous Random Variables

Continuous Random Variables

- ✓ Normal distribution $X \sim N(\mu, \sigma^2)$
- ✓ Standard normal distribution $Z \sim N(0,1)$
- ✓ Chi-square distribution $X \sim \chi_n^2$
- ✓ t-Student distribution $X \sim t_n$
- ✓ F distribution $X \sim F_{n,m}$

Probability distributions of Continuous Variables

A continuous random variable X can assume any value over an interval.

2 characteristics (similar to discrete variables):

1. For any interval $[a, b]$, $0 \leq P(a < X < b) \leq 1$

2. The total probability of all the intervals within which X can assume a value is 1

$$\Sigma\, P(-\infty < X < +\infty) = 1$$

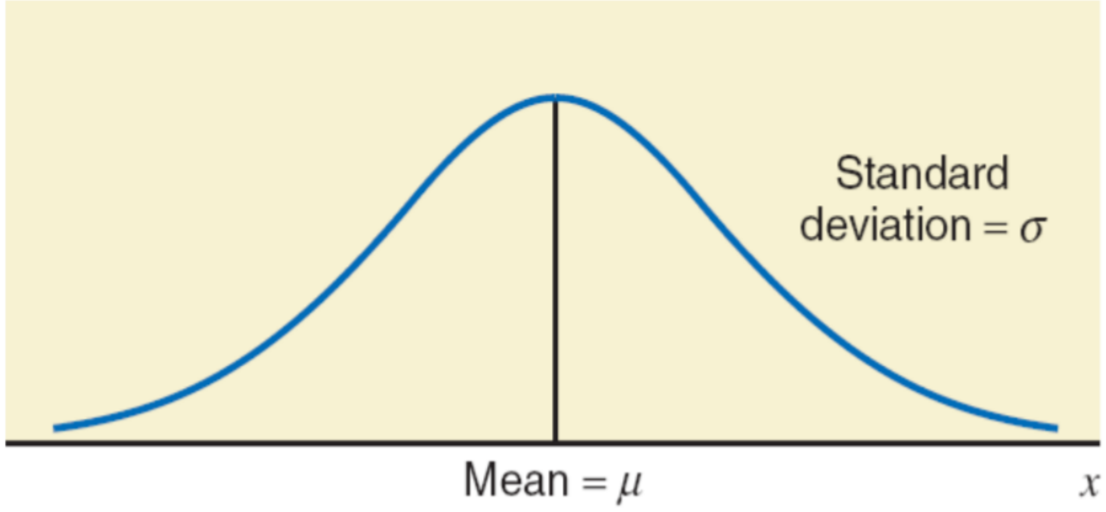
Normal distribution function, $N(\mu, \sigma^2)$

Most widely used continuous probability distribution

$$x \sim N(\mu, \sigma^2)$$

Density function: $f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left\{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2\right\}$

parameters: μ (mean), and σ (the spread)

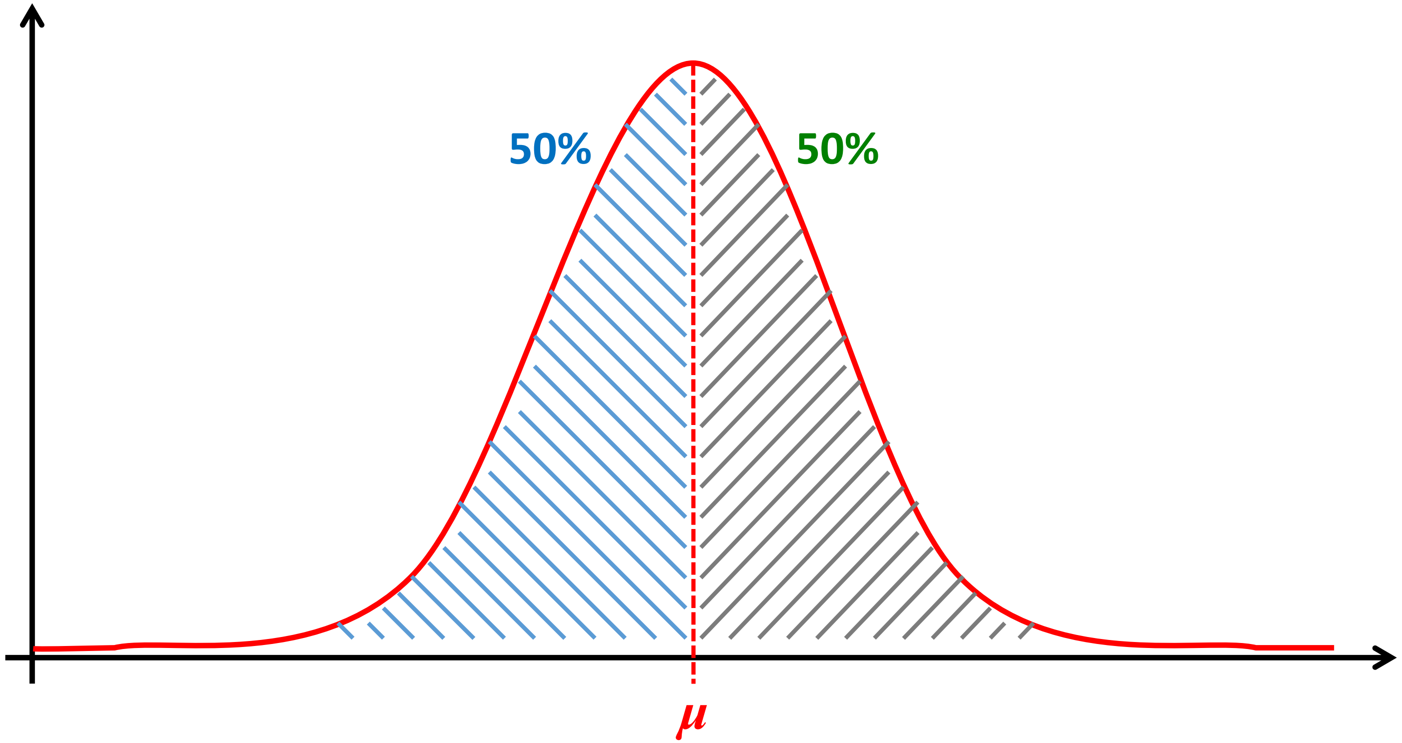


Some examples of things that follow a Normal Distribution:

- Heights of people
- Size of items produced by a machine
- Errors in measurements
- Blood Pressure
- Test Scores

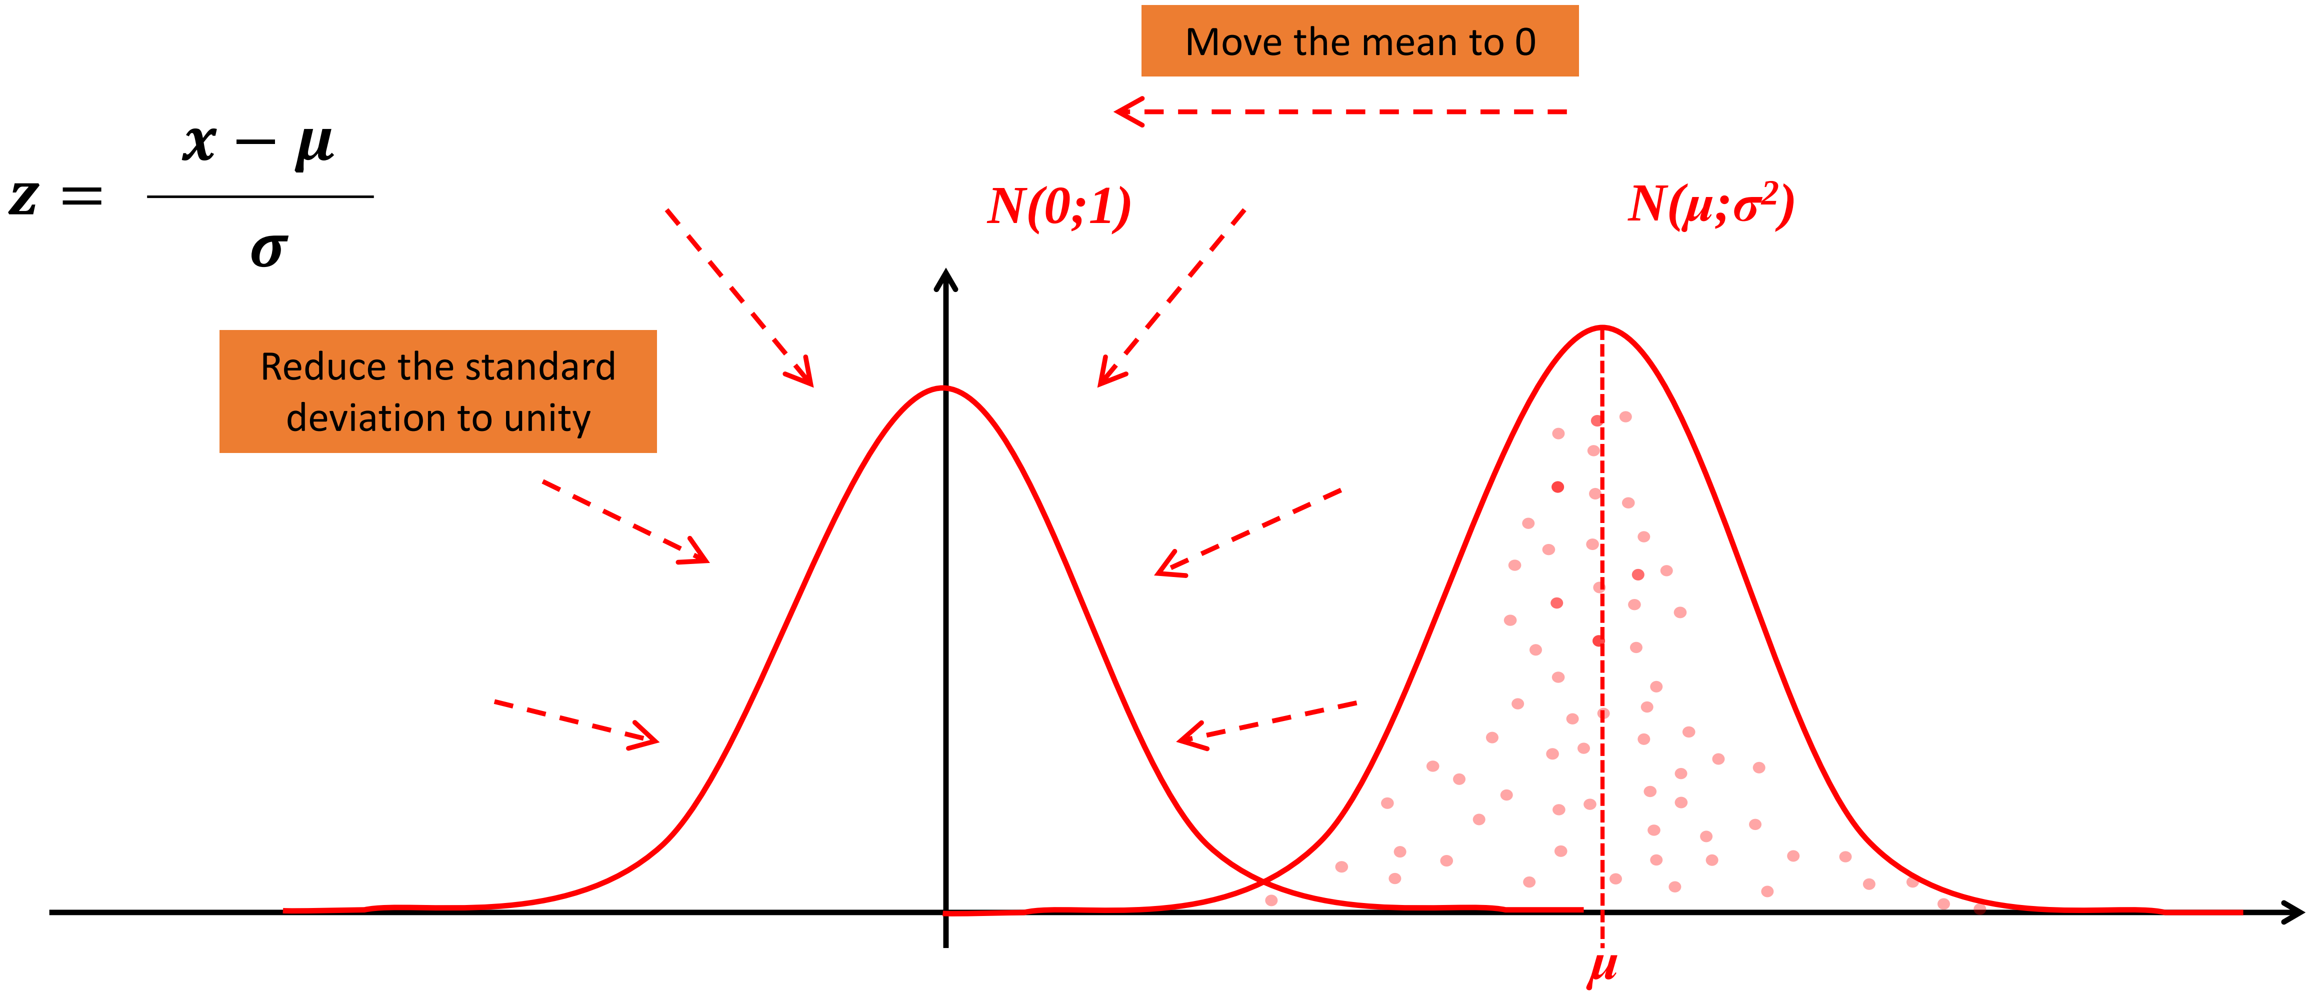
Normal distribution

- It is a bell-shaped curve
- Symmetry about the mean μ (mean = mode = median)
- The total area under the curve is 1 (or 100%)
- 50% of the area is to the left of the mean, and 50% to the right



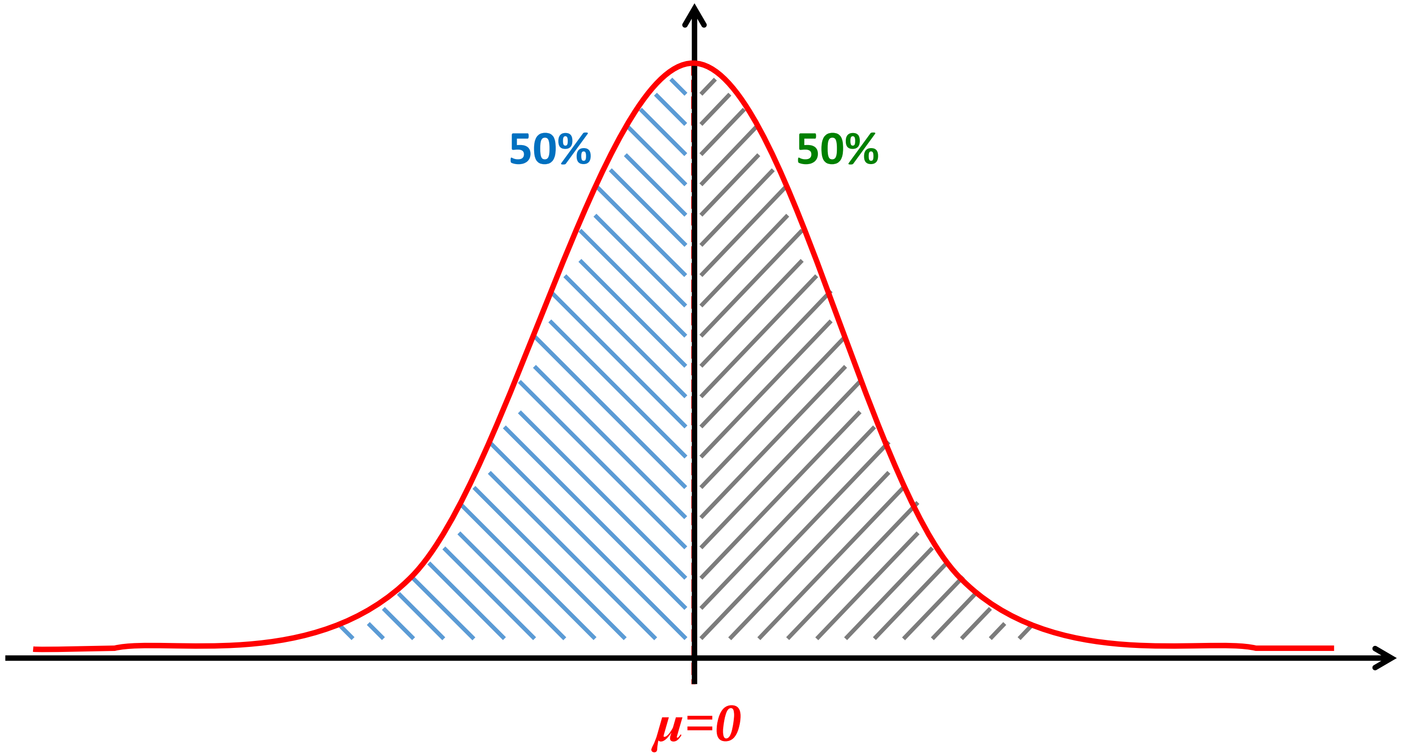
The Standard Normal Distribution, Z, is a Normal Distribution with mean equal to 0 and standard deviation equal to 1, $Z \sim N(0,1)$

ANY Normal distribution, $X \sim N(\mu,\ \sigma^2)$, can be converted into a Standard Normal, $Z \sim N(0,1)$, by standardization: $$z = \frac{x-\mu}{\sigma}$$



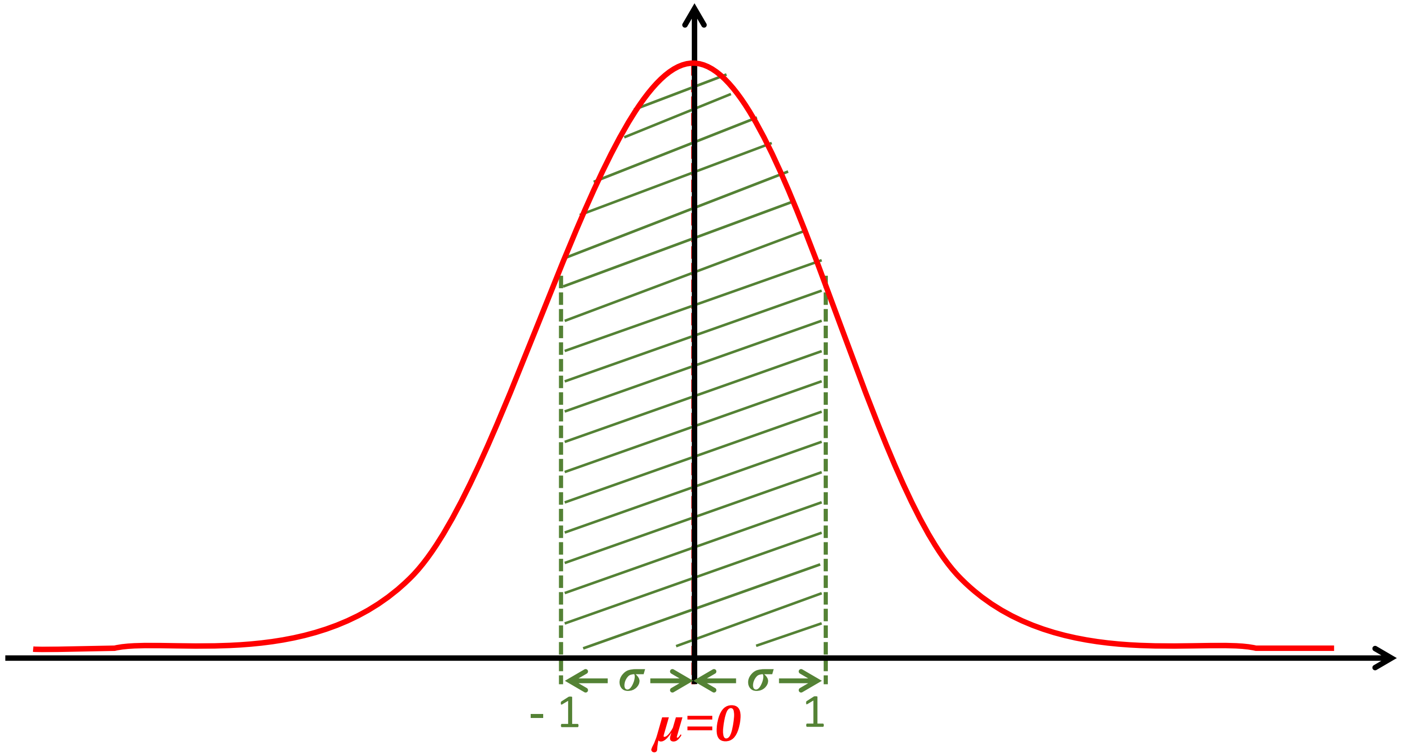
Standard normal distribution, Z:

- It is a bell-shaped curve
- Symmetry about the mean μ (mean = mode = median)
- The total area under the curve is 1 (or 100%)
- 50% of the area is to the left of the mean, and 50% to the right
- Also for standard normal distribution



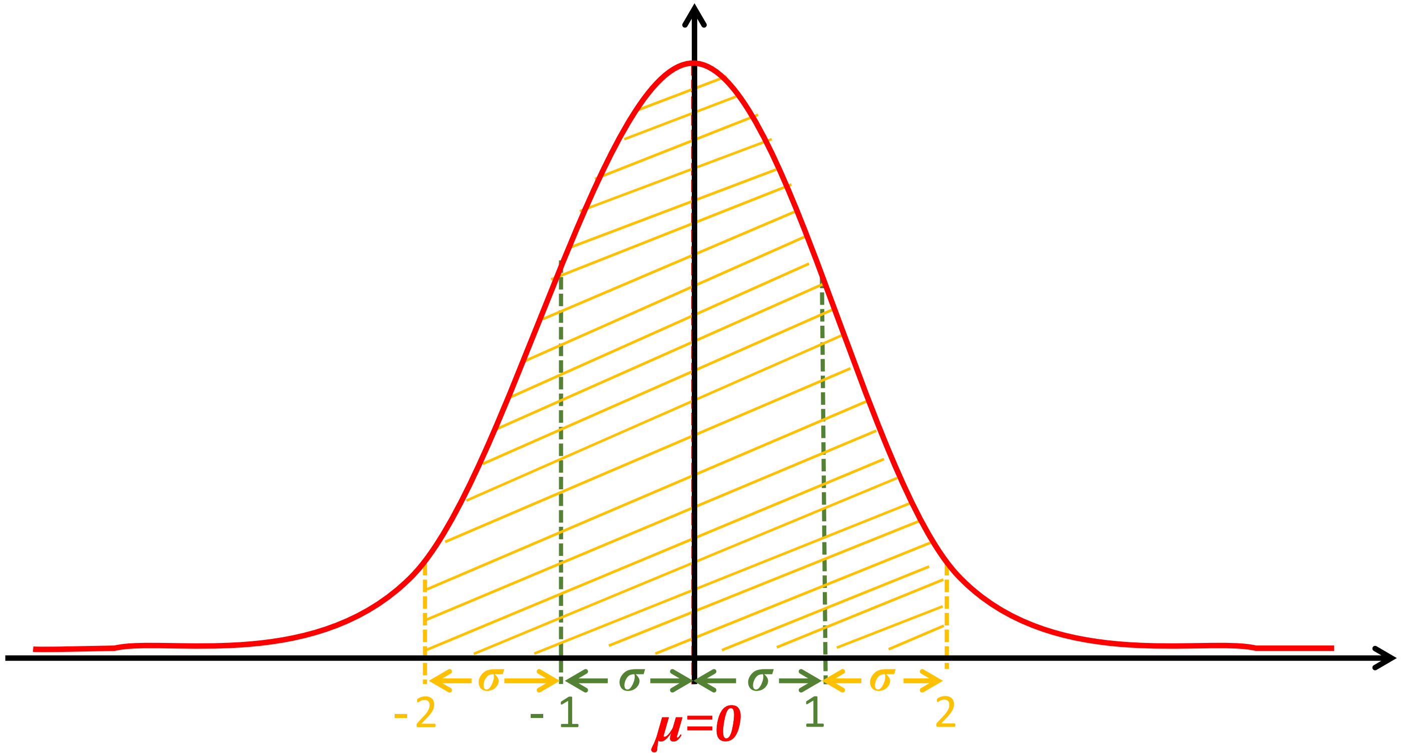
Standard normal distribution, *Z*:

- It is a bell-shaped curve
- Symmetry about the mean μ (mean = mode = median)
- The total area under the curve is 1 (or 100%)
- 50% of the area is to the left of the mean, and 50% to the right
- Also for standard normal distribution
- Approximately **68.3%** of the area is between [μ-σ=-1; μ-σ=1]



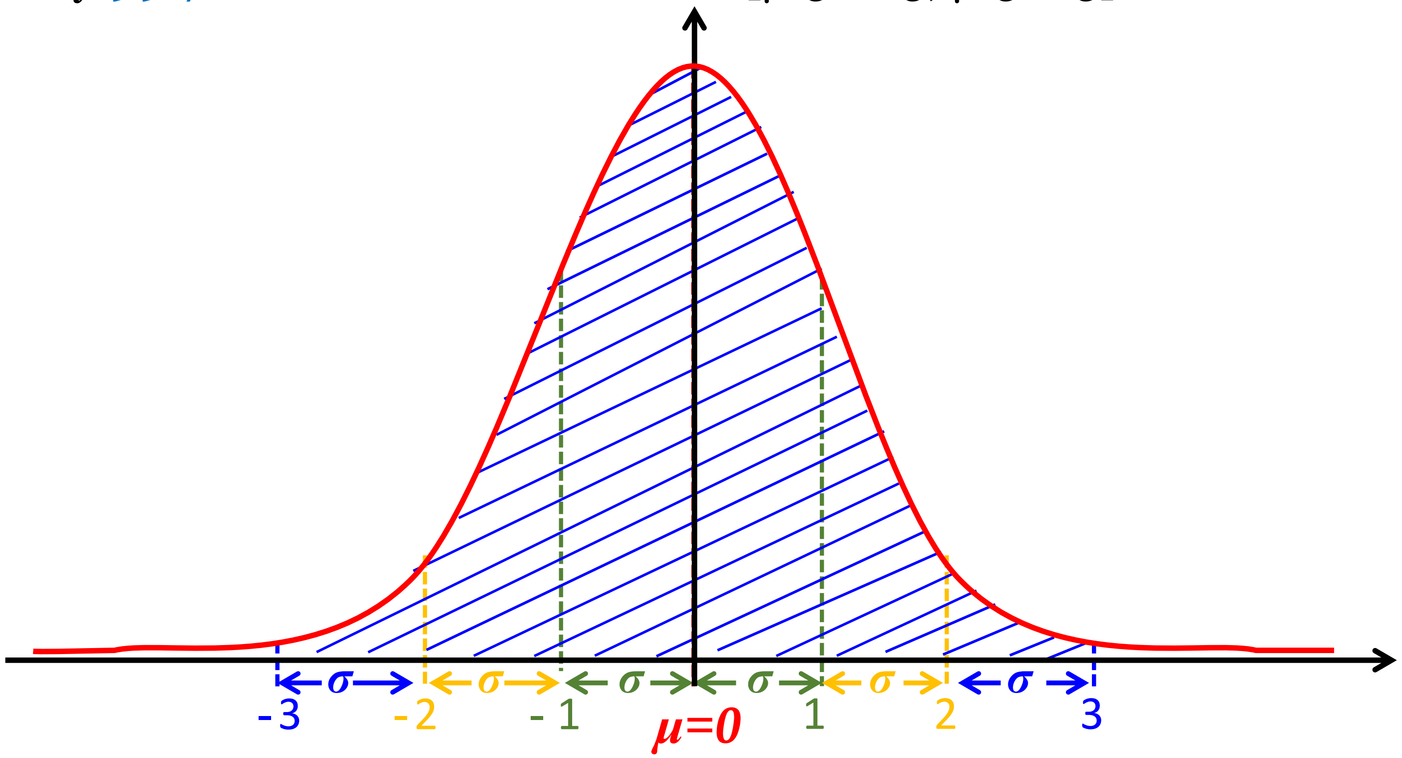
Standard normal distribution, *Z*:

- It is a bell-shaped curve
- Symmetry about the mean μ (mean = mode = median)
- The total area under the curve is 1 (or 100%)
- 50% of the area is to the left of the mean, and 50% to the right
- Also for standard normal distribution
- Approximately **68.3%** of the area is between [μ-σ=-1; μ-σ=1]
- Approximately **95.4%** of the area is between [μ-2σ=-2; μ-2σ=2]



Standard normal distribution, *Z*:

- It is a bell-shaped curve
- Symmetry about the mean μ (mean = mode = median)
- The total area under the curve is 1 (or 100%)
- 50% of the area is to the left of the mean, and 50% to the right
- Also for standard normal distribution
- Approximately **68.3%** of the area is between $[\mu\text{-}\sigma=-1;\ \mu\text{-}\sigma=1]$
- Approximately **95.4%** of the area is between $[\mu\text{-}2\sigma=-2;\ \mu\text{-}2\sigma=2]$
- Approximately **99.7%** of the area is is between $[\mu\text{-}3\sigma=-3;\ \mu\text{-}3\sigma=3]$



Why it is so useful the Standard Normal Distribution $Z \sim N(0,1)$ and the standardization of a Normal distribution in a Standard Normal Distribution?

We have the tables of the Standard Normal Distribution $Z \sim N(0,1)$

From the tables,

The area in the t

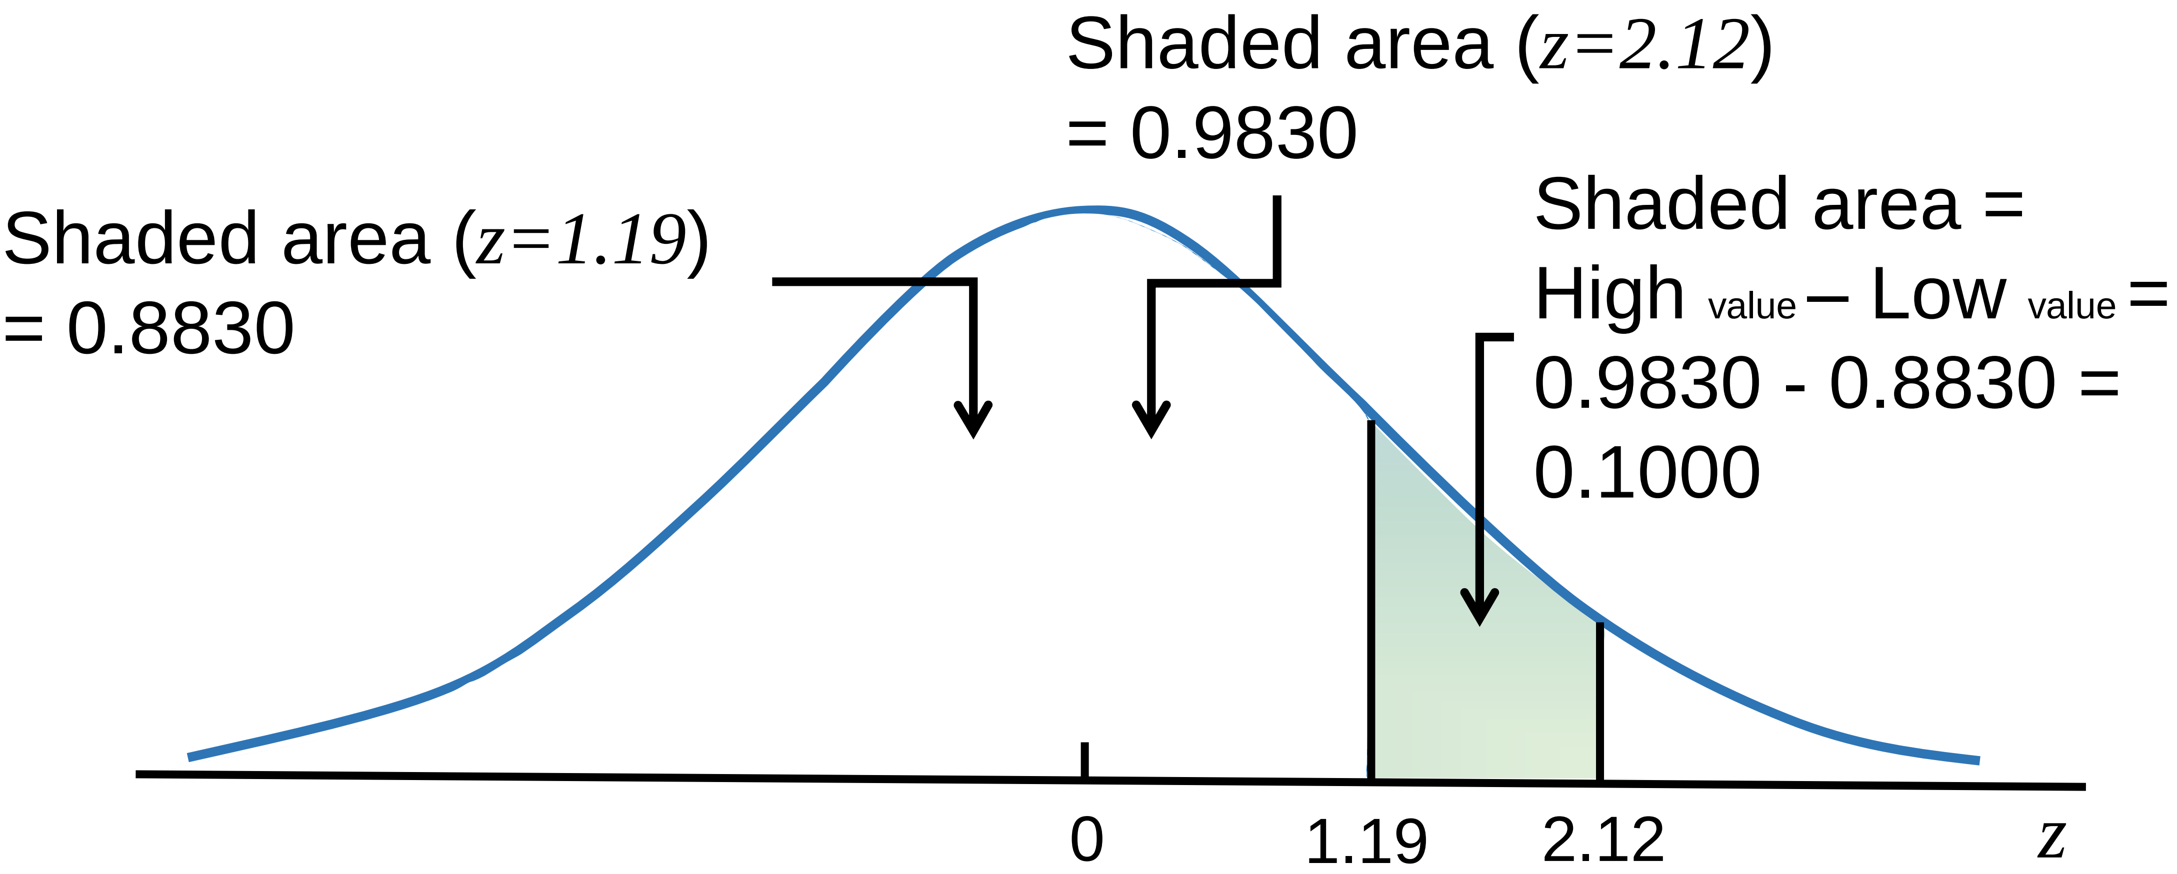
b. P(z>2.32) = 0.0102 = 1.02%



c. $P(1.19<z<2.12) = 0.1000 = 10\%$

Exercise 4

X is a normally distributed variable with mean $\mu = 30$ and standard deviation $\sigma = 4$. Find

a. $P(x < 40)$
b. $P(x > 21)$
c. $P(30 < x < 35)$

Solution

To solve the point a., b., c. we have to convert the Normal distribution, X in the Normal standard distribution, Z, by standardization:

$$z = \frac{x - \mu}{\sigma}$$

with mean $\mu = 30$ and standard deviation $\sigma = 4$.

a. For x = 40, the z-value (or z-score) is: $z = (40 - 30) / 4 = 2.5$
   Hence $P(x < 40) = P(z < 2.5)$ = [area to the left of 2.5] (from the Normal standard distribution table) = 0.9938 = 99.38%

b. For x = 21, the z-score is: $z = (21 - 30) / 4 = -2.25$
   Hence $P(x > 21) = P(z > -2.25)$ = [total area] - [area to the left of -2.25] = $1 – P(z<-2.25) = 1 - 0.0122 = 0.9878$ = 98.78%

c. For x = 30: $z = (30 - 30) / 4 = 0$ and for x = 35: $z = (35 - 30) / 4 = 1.25$
   Hence $P(30 < x < 35) = P(0 < z < 1.25)$ = High value – Low value = $P(z<1.25) – P(z<0)$ =
   = [area to the left of z = 1.25] - [area to the left of 0] = 0.8944 - 0.5 = 0.3944 = 39.44%

Exercise 5

A radar unit is used to measure speeds of cars on a motorway. The speeds are normally distributed with a mean of 90 km/hr and a standard deviation of 10 km/hr. What is the probability that a car picked at random is travelling at more than 100 km/hr?

Solution

Let X be the random variable that represents the speed of cars.

X has $\mu = 90$ and $\sigma = 10$.

We have to find the probability that x is higher than 100 or $P(x > 100)$

For x = 100, the z-score is: $z = (100 - 90) / 10 = 1$

$P(x > 90) = P(z > 1)$ = [total area] - [area to the left of z = 1] = $1 - P(z<1) = 1 - 0.8413 = 0.1587$

The probability that a car selected at a random has a speed greater than 100 km/hr is the 15.87%

Exercise 6

For a certain type of computers, the length of time bewteen charges of the battery is normally distributed with a mean of 50 hours and a standard deviation of 15 hours. John owns one of these computers and wants to know the probability that the length of time will be between 50 and 70 hours.

Solution

Let x be the random variable that represents the length of time.

It has a mean of 50 and a standard deviation of 15.

We have to find the probability that x is between 50 and 70 or $P(50< x < 70)$

For $x = 50$ the z-score is: $z = (50 - 50) / 15 = 0$

For $x = 70$ the z-score is: $z = (70 - 50) / 15 = 1.33$ (rounded to 2 decimal places)

$P(50< x < 70) = P(0< z < 1.33)$ = [area to the left of $z = 1.33$] - [area to the left of $z = 0$] = $P(z<1.33) - P(z<0)=$
$=0.9082 - 0.5 = 0.4082$.

The probability that John's computer has a length of time between 50 and 70 hours is the 40,82%.

Exercise 7

Entry to a certain University is determined by a national test. The scores on this test are normally distributed with a mean of 500 and a standard deviation of 100. Tom wants to be admitted to this university and he knows that he must score better than at least 70% of the students who took the test. Tom takes the test and scores 585. Will he be admitted to this university?

Solution

Let X be the random variable that represents the scores.

X is normally ditsributed with a mean of 500 and a standard deviation of 100.

The total area under the normal curve represents the total number of students who took the test.

If we multiply the values of the areas under the curve by 100, we obtain percentages.

For $x = 585$ the z-score is: $z = (585 - 500) / 100 = 0.85$

The proportion P of students who scored below 585 is given by:

$P(z<0.85)$ = [area to the left of $z = 0.85$] = 0.8023 = 80.23%

Tom scored better than 80.23% of the students who took the test and he will be admitted to this University.

Exercise 8

The time taken to assemble a car in a certain plant is a random variable having a normal distribution of 20 hours and a standard deviation of 2 hours. What is the probability that a car can be assembled at this plant at this plant in a period of time

a) less than 19.5 hours?

b) between 20 and 22 hours?

Solution

a) We have to calculate the probability that a car can be assembled in less than 19.8 hours or $P(x < 19.5)$

The z-score for x=19.9 is: $z = (19.5-20)/2$, so we have to calculate from the table of Z the probability:

$P(z < -0.25) = 0.4013 = 40.13\%$

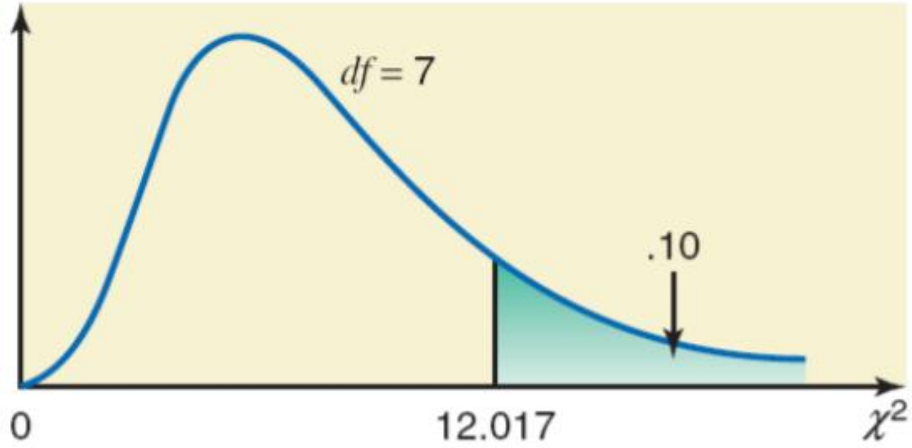
b) We have to calculate the probability that a car can be assembled between 20 and 22 hours or $P(20 < x < 22)$

The z-score for x=20 is z=0 and for x=22 is z=1. So,

$P(0 < z < 1) = P(z<1) – P(z<0) = 0.8413 - 0.5 = 0.3413 = 34.13\%$

Chi square distribution, $\chi 2$

Let $Z_1, Z_2, Z_3, \dots, Z_n$, be n i.i.d. random variables $Z_i \sim N(0,1)$



$$X = \sum_{i=1}^{n} Z_i \sim \chi_n^2$$

where n=degrees of freedom (only parameter)

$E(X) = n$ and $V(X) = 2n$

t-Student distribution, t_n

Let $Z \sim N(0,1)$ and $Y \sim \chi^2_n$,

$$X = \frac{Z}{\sqrt{Y/n}} \sim t_n$$

where n = degrees of freedom

- The total area under a t-student distribution curve is 1
- Distribution is bell-shaped and symmetric around $E(X) = 0$
- $V(X) = n/n{-}2$, for $n > 2$
- For $n > 60$, X converges to $Z \sim N(0,1)$

F distribution, $F_{n,m}$

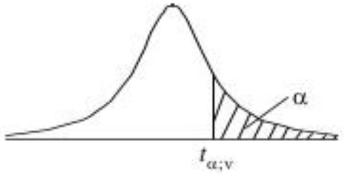
Let X~χ_m^2 and Y~χ_n^2,

$$F = \frac{X/m}{Y/n} \sim F_{m,n}$$

where m = numerator's degree of freedom, n = denominator's degree of freedom (2 parameters)

The total area under F distribution curve is 1

Table of the Student's *t*-distribution



The table gives the values of $t_{\alpha;\nu}$ where
$\Pr(T_\nu > t_{\alpha;\nu}) = \alpha$, with ν degrees of freedom

Exercise 9

a. Find the value of t for 24 df and 0.05 area in the right tail (*one-sided*);

b. Find the value of t for 24 df and 0.05 in the *two-sided* area ;

c. Find the probability that a r.v. t for 24 df assumes a value greater than 2.5;

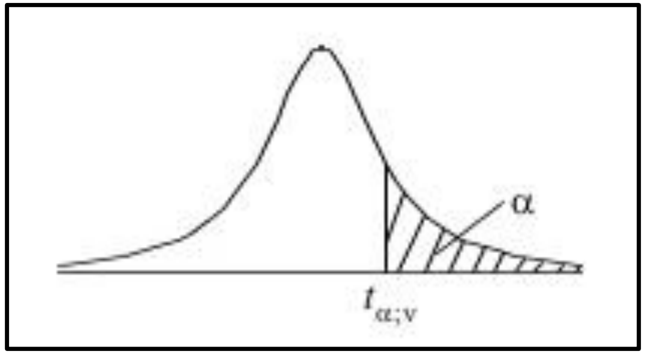
d. Find the probability that a r.v. t for 24 df assumes a value greater than 1.5;

e. Find the probability that a r.v. χ^2 for 3 df assumes a value greater than or equal to 7;

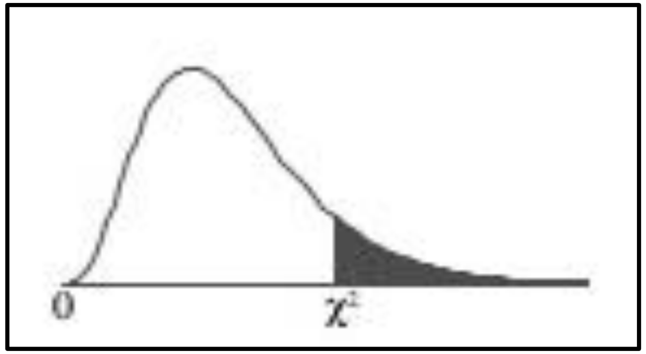
f. Find the probability that a r.v. χ^2 for 5 df leaves in the right tail a probability of 0.1;

g. Find the probability tha a r.v. $F_{10,10}$ leaves in the right tail a probability of 0.05.

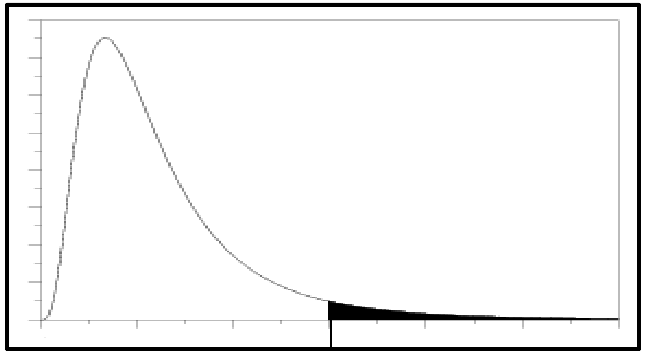
Student's T



χ^2



F



Exercise 9

Solution

a. We have to find the 95% percentile of the t di Student with 24 df : $t_{24,0.05}$. From the table the value is: 1.711

b. We have to find the 2.5% e 97.5% percentile that border the two-sided area that leaves in the tail a probability of 5%. From the table $t_{24,0.025} = 2.064$ and $t_{24,0.975} = -2.064$

c. If $X \sim t_{24}$ then, $P(X > 2.5)=0.01$

d. If $X \sim t_{24}$ then, $0.05 \leq P(X > 1.5) \leq 0.1$

e. If $X \sim \chi^2_3$, then $0.05 \leq P(X > 7) \leq 0.1$

f. From the table the 90% percentile of the distribution of the r.v. $\chi^2_{(5\,,\,0.1)}$ with 5 df and a probability of 0.1 on the right tail is 9.236

g. From the table the 95% percentile of the distribution of the r.v. $F_{10,10}$ and a probability on the right tail of 0.05 is 2.9782

In Teams under “General” (Generale) - “Assignment” (“Attività”) you can find the test:

“Quantitative Methods I - Test”.

The test is for you and it is used to better understand if all the themes of the first part of the course are clear.

The result of the test will not be used for the final exam.
