# COM1011

## Fundamentals of Machine Learning

# Previously on COM1011:

overfitting

train-test split

$R^2$

$$y = a_1x_1 + a_2x_2 + a_3x_3 + b$$

Yamir Moreno @cosnet\_bifi · 12h

Replying to @cosnet\_bifi

Our results clearly show that higher vaccine hesitancy ratios lead to larger outbreaks. This, however, cannot be translated directly into deaths since age plays a very important. Work with A. de Miguel & @SrAleta. Data from [covidstates.org](https://covidstates.org). (2/2)

# Today:

- Introduction to classification
- Logistic regression
- Linear classifiers
- The perceptron algorithm

# Train-test split

- **Train** your algorithm on part of the data on part of the data
- **Test** it on another part
- Splits are usually around 80% train, 20% test
- This can be used with all sorts of ML algorithms

# Classification

- Using  $x$  and  $y$  only
- Can you predict which dots are **red** and which ones are **blue**?

OR:

- Can you *classify* the  $(x, y)$  pairs into red or blue?

Regression

Classification

**DATA**

## Regression

What is the temperature going to be tomorrow?

**DATA**

## Regression

What is the temperature going to be tomorrow?

**DATA**

## Classification

Will it be Cold or Hot tomorrow?

# Classification is used everywhere

# Classification is supervised learning.

**Supervised Learning**

1. You **train** the algorithm using some correct examples, or “ground truth data”
2. A trained algorithm can make predictions about new data

# Classification is supervised learning.

**Input:** smells

**Output:** banana or apple?

1. You **train** the algorithm using some correct examples, or “ground truth data”
2. A trained algorithm can make predictions about new data

# Regression is also supervised learning.

1. You **train** the algorithm using some correct examples, or “ground truth data”
2. A trained algorithm can make predictions about new data

# Regression is also supervised learning.

1. You **train** the algorithm using some correct examples, or “ground truth data”
2. A trained algorithm can make predictions about new data

# Regression is also supervised learning.

1. You **train** the algorithm using some correct examples, or “ground truth data”
2. A trained algorithm can make predictions about new data

# First classifier: Logistic Regression

*Is it a star?*

The input:

$\mathbf{x}$  = continuous data

$y$  = binary data

# Logistic Regression

The input:

$x$  = continuous data

$y$  = binary data

# Logistic Regression

The input:

$x$  = continuous data

$y$  = binary data

# Logistic Regression

**The input:**

$x$  = continuous data

$y$  = binary data

**The model:**

$$y = \frac{1}{1 + e^{-(ax+b)}}$$

Play with the parameters at: [desmos.com/calculator](https://desmos.com/calculator)

# Logistic Regression

**The input:**

$x$  = continuous data

$y$  = binary data

**The model:**

$$y = \frac{1}{1 + e^{-(ax+b)}}$$

Play with the parameters at: [desmos.com/calculator](https://desmos.com/calculator)

# Logistic Regression

**The input:**

$x$  = continuous data

$y$  = binary data

**The model:**

$$y = \frac{1}{1 + e^{-(ax+b)}}$$

Play with the parameters at: [desmos.com/calculator](https://desmos.com/calculator)

# Logistic Regression

**The input:**

$x$  = continuous data

$y$  = binary data

**The model:**

$$y = \frac{1}{1 + e^{-(ax+b)}}$$

Play with the parameters at: [desmos.com/calculator](https://desmos.com/calculator)

# Logistic Regression

The model:

$$y = \frac{1}{1 + e^{-(ax+b)}}$$

The interpretation:

The model gives the probability of  $y = 1$ , for a given value of  $x$

# Logistic Regression

**The model:**

$$y = \frac{1}{1 + e^{-(\sum_i a_i x_i + b)}}$$

**The interpretation:**

The model gives the probability of  $y = 1$ , for a given value of  $x_i$

# Cost function:

```
log_reg.fit(X_train, y_train)
```

# Cost function:

```
log_reg.fit(X_train, y_train)
```

# The score is also different: no more $R^2$

```
score = log_reg.score(X_test, y_test)
```

# The score is also different: no more $R^2$

```
score = log_reg.score(X_test, y_test)
```

<code>decision_function(X)</code>	Predict confidence scores for samples.
<code>densify()</code>	Convert coefficient matrix to dense array format.
<code>fit(X, y[, sample_weight])</code>	Fit the model according to the given training data.
<code>get_params([deep])</code>	Get parameters for this estimator.
<code>predict(X)</code>	Predict class labels for samples in X.
<code>predict_log_proba(X)</code>	Predict logarithm of probability estimates.
<code>predict_proba(X)</code>	Probability estimates.
<code>score(X, y[, sample_weight])</code>	Return the mean accuracy on the given test data and labels.
<code>set_params(**params)</code>	Set the parameters of this estimator.
<code>sparsify()</code>	Convert coefficient matrix to sparse format.

	Actual Positives	Actual Negatives
Positive Predictions	True Positives (TP)	False Positives (FP)
Negative Predictions	False Negatives (FN)	True Negatives (TN)

Here's our score:

$$\text{Accuracy} = \frac{\text{TP} + \text{TN}}{\text{TP} + \text{TN} + \text{FP} + \text{FN}}$$

# Second example: the Perceptron

# The Perceptron

# Perceptron in more dimensions

$$z = ax + by$$

or

$$y = a_1x_1 + a_2x_2$$

# The Perceptron

# The Perceptron

# The Perceptron

# The Perceptron

# The Perceptron

# Training a perceptron

1. Initialise the vector  $w$  at 0.
2. Keep cycling through the data
3. For every  $x$ , try classifying it:  
$$y^{pred} = f(w \cdot x + b)$$
4. Update  $w$ :  
$$w_{t+1} = w_t + \alpha(y^{data} - y^{pred})x$$
5. If the prediction is correct,  $w$  is not updated.

# Training a perceptron

Learning the  $w_i$  weights

= learning the coefficients of the line

# Training a perceptron

$$(x_1, x_2) = (x, y)$$

Learning the  $w_i$  weights  
= learning the coefficients of the line

# Training a perceptron

$$(x_1, x_2) = (x, y)$$

Learning the  $w_i$  weights  
= learning the coefficients of the line

# Training a perceptron

$$(x_1, x_2) = (x, y)$$

Learning the  $w_i$  weights  
= learning the coefficients of the line

# Perceptron in more dimensions

$$y = f \left( b + \sum_{i=1}^K w_i x_i \right)$$

# The weakness of perceptrons: **linear separability**

Perceptron can do

Perceptron can't do

# The solution: Multi Layer Perceptron

# The solution: Multi Layer Perceptron

# The MLP is the simplest neural network.

# The MLP is the simplest neural network.

**every neuron:**

$$y = f \left( b + \sum_{i=1}^K w_i x_i \right)$$

# Neural networks
